The Wide Angle Search for Planets (WASP)

Pierre Maxted

Astrophysics Group, Keele University, Staffordshire, UK

The WASP project has discovered over 100 extrasolar planets orbiting bright solar-type stars. I will describe the instrumentation and methods used by the WASP project and highlight some of the most important extrasolar planets that we have discovered so far. I will also briefly describe some interesting science results that have come out of the WASP project in areas other than extrasolar planet studies.
