Abstract:

This talk is based on work with Anja Marunovic (arXiv:1101.5059 [gr-qc], arXiv:1209.4779 [hep-th]) and on recent work with S. Park and R. P. Woodard (arXiv:1510.03352). We employ the graviton self-energy induced by a massless, minimally coupled scalar on de Sitter background to compute the quantum corrections to the gravitational potentials of a static point particle with a mass M . The Schwinger-Keldysh formalism is used to derive real and causal effective field equations. When evaluated at the one-loop order, the gravitational potentials exhibit a secular decrease in the observed gravitational coupling G . This can also be interpreted as a (time dependent) anti-screening of the mass M .
