**Sigma models from Courant algebroids and background
fluxes of string theory**

Abstract:

We present a membrane sigma model constructed from the Courant algebroid data that could provide a consistent world-sheet approach to realizing new geometries appearing in string theory. We show that at the level of the world-sheet sigma model action one is naturally lead to an apparent doubling of degrees of freedom by careful analysis of equation of motion. Furthermore, the bulk/boundary consistency condition provides a well-defined procedure for obtaining the 2D reduced theory with background fluxes. We discuss some of the results from the perspective of gauged sigma model.
