Introduction to B decays

Two main reasons to study B physics:

- **Reason 1:** measuring Standard Model (SM) parameters

Introduction to B decays

Two main reasons to study B physics:

- **Reason 1:** measuring Standard Model (SM) parameters

$$V_{\text{CKM}} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

Kobayashi-Maskawa
(4 independent parameters)

Introduction to B decays

Two main reasons to study B physics:

- **Reason 1:** measuring Standard Model (SM) parameters

$$V_{\text{CKM}} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix} \quad \text{Kobayashi-Maskawa} \\ \text{(4 independent parameters)}$$

- ▶ Wolfenstein parametrization is more popular:

$$V_{\text{CKM}} = \begin{pmatrix} 1 - \lambda^2/2 & \lambda & A\lambda^3(\rho - i\eta) \\ \lambda & 1 - \lambda^2/2 & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix}$$

Introduction to B decays

Two main reasons to study B physics:

- **Reason 1:** measuring Standard Model (SM) parameters

$$V_{\text{CKM}} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix} \quad \text{Kobayashi-Maskawa} \\ \text{(4 independent parameters)}$$

- ▶ Wolfenstein parametrization is more popular:

$$V_{\text{CKM}} = \begin{pmatrix} 1 - \lambda^2/2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \lambda^2/2 & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix}$$

- ▶ parameters involving 3rd quark family still poorly known

Introduction to B decays (2)

- Reason 2: looking for New Physics beyond SM

Introduction to B decays (2)

- **Reason 2:** looking for New Physics beyond SM
 - via new CP violation phases
(richer CP-viol. phenomenology than in K physics)

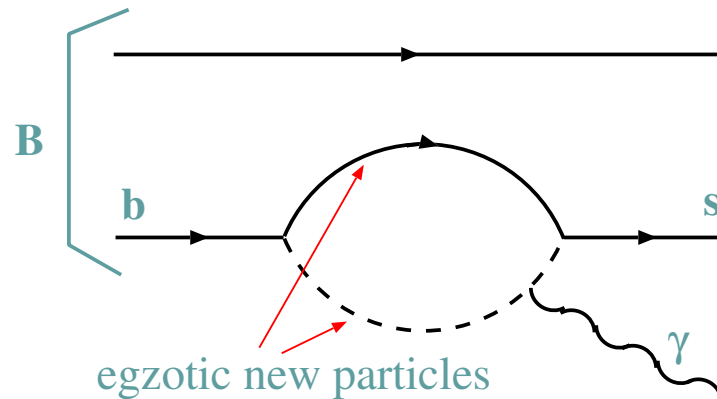

Introduction to B decays (2)

- **Reason 2:** looking for New Physics beyond SM
 - via new CP violation phases
(richer CP-viol. phenomenology than in K physics)
 - via quantum loops involving new particles

Introduction to B decays (2)

- **Reason 2:** looking for New Physics beyond SM
 - via new CP violation phases (richer CP-viol. phenomenology than in K physics)
 - via quantum loops involving new particles

example:

Introduction to B decays (2)

- **Reason 2:** looking for New Physics beyond SM
 - via new CP violation phases (richer CP-viol. phenomenology than in K physics)
 - via quantum loops involving new particles

example:

- ▶ precision loop calculations are less QCD-polluted because of the large energy scale $\sim m_b$ (asymptotic freedom)

Types of B decays

● leptonic

$$\langle 0 | \mathbf{J}_{\text{had.}}^{\text{weak}} | B \rangle \propto F_B$$

Types of B decays

- leptonic

$$\langle 0 | \mathbf{J}_{\text{hadr.}}^{\text{weak}} | B \rangle \propto F_B$$

- semi-leptonic

$$\langle D | \mathbf{J}_{\text{hadr.}}^{\text{weak}} | B \rangle \propto F_0(q^2), F_1(q^2)$$

Types of B decays (2)

- non-leptonic

$$\langle D\pi | J_{\text{hadr.1}}^{\text{weak}} J_{\text{hadr.2}}^{\text{weak}} | B \rangle \rightarrow \text{very complicated}$$

Types of B decays (2)

- non-leptonic

$$\langle D\pi | J_{\text{hadr.1}}^{\text{weak}} J_{\text{hadr.2}}^{\text{weak}} | B \rangle \rightarrow \text{very complicated}$$

► Factorization assumption:

$$\approx \langle \pi | J_{\text{hadr.1}}^{\text{weak}} | 0 \rangle \langle D | J_{\text{hadr.2}}^{\text{weak}} | B \rangle \propto f_{\pi}, F_0(q^2), F_1(q^2)$$

Types of B decays (2)

- non-leptonic

$$\langle D\pi | J_{\text{hadr.1}}^{\text{weak}} J_{\text{hadr.2}}^{\text{weak}} | B \rangle \rightarrow \text{very complicated}$$

- ▶ Factorization assumption:

$$\approx \langle \pi | J_{\text{hadr.1}}^{\text{weak}} | 0 \rangle \langle D | J_{\text{hadr.2}}^{\text{weak}} | B \rangle \propto f_\pi, F_0(q^2), F_1(q^2)$$

- explanation: fast pion \rightarrow “color transparency”

Types of B decays (2)

- non-leptonic

$$\langle D\pi | J_{\text{hadr.1}}^{\text{weak}} J_{\text{hadr.2}}^{\text{weak}} | B \rangle \rightarrow \text{very complicated}$$

► Factorization assumption:

$$\approx \langle \pi | J_{\text{hadr.1}}^{\text{weak}} | 0 \rangle \langle D | J_{\text{hadr.2}}^{\text{weak}} | B \rangle \propto f_{\pi}, F_0(q^2), F_1(q^2)$$

- explanation: fast pion \rightarrow “color transparency”
- improved approaches (QCD factorization, ...)

Experimental data

- CLEO, Belle and BaBar collaborations see a lot of η' 's in charmless (rare) hadronic B decays ...

$$\text{Br}(B^+ \rightarrow K^+ \eta') = (77 \pm 5) \cdot 10^{-6}$$

$$\text{Br}(B^0 \rightarrow K^0 \eta') = (61 \pm 6) \cdot 10^{-6}$$

- ... as compared to the π 's:

$$\text{Br}(B^+ \rightarrow K^+ \pi^0) = (13 \pm 1) \cdot 10^{-6}$$

$$\text{Br}(B^0 \rightarrow K^0 \pi^0) = (11 \pm 1) \cdot 10^{-6}$$

- 7 free parameters — to be predictive one assumes that some can be neglected

Singlet penguin part

● $SP =$

Singlet penguin part

● $SP =$

● [Chiang, Gronau, Rosner (2003)]: $SP/P \approx 0.4 - 0.8$

Singlet penguin part

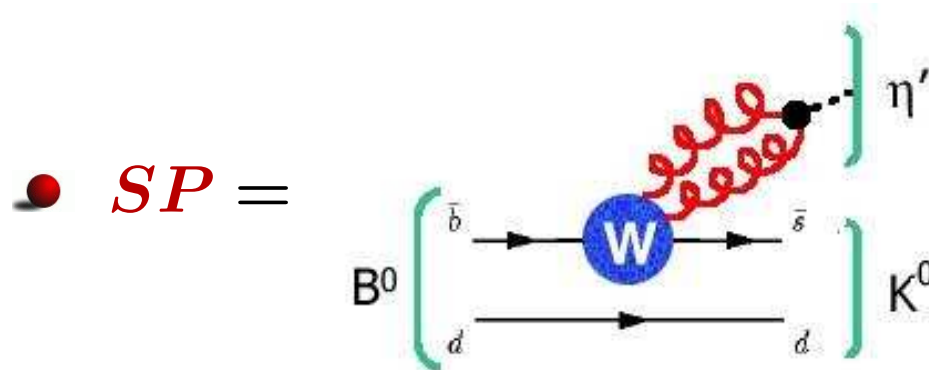

• $SP =$

• [Chiang, Gronau, Rosner (2003)]: $SP/P \approx 0.4 - 0.8$

• Possible objections:

Singlet penguin part

- [Chiang, Gronau, Rosner (2003)]: $SP/P \approx 0.4 - 0.8$
- Possible objections:
 - $SU(3)_F$ symmetry broken

Singlet penguin part

● $SP =$

● [Chiang, Gronau, Rosner (2003)]: $SP/P \approx 0.4 - 0.8$

● Possible objections:

- $SU(3)_F$ symmetry broken
- $\eta - \eta'$ mixing implementation

Singlet penguin part

● [Chiang, Gronau, Rosner (2003)]: $SP/P \approx 0.4 - 0.8$

● Possible objections:

- $SU(3)_F$ symmetry broken
- $\eta - \eta'$ mixing implementation
- Hybrid method (symmetry + quark dynamics), overcomplete basis: more flavour topologies than true $SU(3)_F$ invariants

Alternative flavour symmetry approaches

- Comparison of different $\eta - \eta'$ mixing implementations (single angle, two angles [Feldman, Kroll, Stech])
→ results practically unchanged

Alternative flavour symmetry approaches

- Comparison of different $\eta - \eta'$ mixing implementations (single angle, two angles [Feldman, Kroll, Stech])
→ results practically unchanged
- "Pure" $SU(3)_F$ symmetry approach (generalization of [Savage and Wise (1989)])

$$\begin{aligned} H_{\text{eff}} = & a B_k H(3)^k P_i^j P_j^i + b B_i H(3)^k P_k^j P_j^i + c B_i H(\bar{6})_k^{ij} P_j^m P_m^k \\ & + d B_i H(15)_k^{ij} P_j^m P_m^k + e B_i H(15)_m^{jk} P_k^m P_j^i + \tilde{f} B_i H(3)^k P_k^i \eta_1 \\ & + \tilde{g} B_i H(\bar{6})_k^{ij} P_j^k \eta_1 + \tilde{h} B_i H(15)_k^{ij} P_j^k \eta_1 + \tilde{s} B_k H(3)^k \eta_1 \eta_1 \end{aligned}$$

Alternative flavour symmetry approaches

- Comparison of different $\eta - \eta'$ mixing implementations (single angle, two angles [Feldman, Kroll, Stech])
→ results practically unchanged
- "Pure" $SU(3)_F$ symmetry approach (generalization of [Savage and Wise (1989)])

$$\begin{aligned} H_{\text{eff}} = & a B_k H(3)^k P_i^j P_j^i + b B_i H(3)^k P_k^j P_j^i + c B_i H(\bar{6})_k^{ij} P_j^m P_m^k \\ & + d B_i H(15)_k^{ij} P_j^m P_m^k + e B_i H(15)_m^{jk} P_k^m P_j^i + \tilde{f} B_i H(3)^k P_k^i \eta_1 \\ & + \tilde{g} B_i H(\bar{6})_k^{ij} P_j^k \eta_1 + \tilde{h} B_i H(15)_k^{ij} P_j^k \eta_1 + \tilde{s} B_k H(3)^k \eta_1 \eta_1 \end{aligned}$$

- we get $SP/P = 0.31 - 0.36$

Alternative flavour symmetry approaches

- Comparison of different $\eta - \eta'$ mixing implementations (single angle, two angles [Feldman, Kroll, Stech])
→ results practically unchanged
- "Pure" $SU(3)_F$ symmetry approach (generalization of [Savage and Wise (1989)])

$$H_{\text{eff}} = a B_k H(3)^k P_i^j P_j^i + b B_i H(3)^k P_k^j P_j^i + c B_i H(\bar{6})_k^{ij} P_j^m P_m^k + d B_i H(15)_k^{ij} P_j^m P_m^k + e B_i H(15)_m^{jk} P_k^m P_j^i + \tilde{f} B_i H(3)^k P_k^i \eta_1 + \tilde{g} B_i H(\bar{6})_k^{ij} P_j^k \eta_1 + \tilde{h} B_i H(15)_k^{ij} P_j^k \eta_1 + \tilde{s} B_k H(3)^k \eta_1 \eta_1$$

- we get $SP/P = 0.31 - 0.36$
- [Fu, He, Hsiao (2003)] $SP/P \approx 0.9$

What about **hard off-shell** gluon contribution? Can it explain the discrepancy?

Comparison of two approaches I

What about **hard off-shell** gluon contribution? Can it explain the discrepancy?

$b \rightarrow sg^*g^*$ amplitude

- [Simma and Wyler (1990)]: small external momenta —
 $p_b, p_s, p_g \ll m_W$

$b \rightarrow sg^*g^*$ amplitude

- [Simma and Wyler (1990)]: small external momenta —
 $p_b, p_s, p_g \ll m_W$
- This work: $p_b, p_s \rightarrow 0$, but general p_g

$b \rightarrow sg^*g^*$ amplitude

- [Simma and Wyler (1990)]: small external momenta —
 $p_b, p_s, p_g \ll m_W$
- This work: $p_b, p_s \rightarrow 0$, but general p_g
- Building blocks:

$b \rightarrow sg^*g^*$ (self-energy)

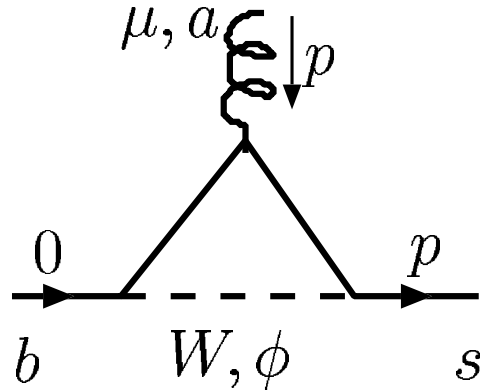

$$b \rightarrow sg^*g^* = \frac{i}{4\pi^2} \frac{G_F}{\sqrt{2}} \Sigma(p)$$

$$\Sigma(p) = -M_W^2 \not{p} L - 2M_W^2 \left(1 + \frac{m_i^2}{2M_W^2} \right) \not{p} L \int_0^1 dx (1-x) \ln \frac{D}{\mu_*^2}$$

$$- \int_0^1 dx \left[(1-x)m_b m_s \not{p} R - m_i^2 (m_b R + m_s L) \right] \ln \frac{D}{\mu_*^2}$$

$$\ln \mu_*^2 = \frac{1}{\epsilon} - \gamma_E + \ln 4\pi \mu^2$$

$b \rightarrow sg^*g^*$ (Triangle)

$$= \frac{i}{4\pi^2} \frac{G_F}{\sqrt{2}} g_s t^a \Gamma^\mu(0, p, -p)$$

$$\Gamma^\mu(0, p, -p) = \frac{4M_W^2}{m_i^2 - M_W^2} \left(1 + \frac{m_i^2}{2M_W^2} \right) (p^2 g^{\mu\nu} - p^\mu p^\nu) \gamma_\nu L \int_0^1 dx x(1-x) \ln \frac{D}{C}$$

$$+ M_W^2 \gamma^\mu L + 2M_W^2 \left(1 + \frac{m_i^2}{2M_W^2} \right) \gamma^\mu L \int_0^1 dx (1-x) \ln \frac{D}{\mu_*^2}$$

$$D = xm_i^2 + (1-x)M_W^2 - x(1-x)p^2$$

$$C = m_i^2 - x(1-x)p^2$$

$b \rightarrow sg^*g^*$ (Box)

$$\begin{aligned}
 I^{\mu\nu}(\mathbf{0}, \mathbf{0}, -\mathbf{p}, \mathbf{p}) &= \frac{2M_W^2}{m_i^2 - M_W^2} \left(1 - \frac{m_i^2}{2M_W^2} \right) (-i\epsilon^{\mu\nu\rho\sigma} p_\sigma \gamma_\rho L) \times \\
 &\quad \times \int_0^1 dx (1-x) \left\{ (3x-1)\mathbb{Y}_1 + [x^2(1-x)p^2 + (x+1)m_i^2]\mathbb{Y}_2 \right\} \\
 &+ \frac{2M_W^2}{m_i^2 - M_W^2} \left(1 + \frac{m_i^2}{2M_W^2} \right) \int_0^1 dx (1-x) \left\{ [-(x+1)\not{p}g^{\mu\nu} - (x-1)(p^\mu\gamma^\nu + p^\nu\gamma^\mu)]\mathbb{Y}_1 \right. \\
 &\quad + \left(x^2(1-x)[-(p^\mu\gamma^\nu + p^\nu\gamma^\mu)p^2 + \not{p}(4p^\mu p^\nu - g^{\mu\nu}p^2)] \right. \\
 &\quad \left. \left. + [-(x+1)\not{p}g^{\mu\nu} - (x-1)(p^\mu\gamma^\nu + p^\nu\gamma^\mu)]m_i^2 \right) \mathbb{Y}_2 \right\} L
 \end{aligned}$$

$\mathbb{Y}_{1,2}$ = complicated functions of x , m_i^2 , M_W^2 , p^2

$b \rightarrow sg^*g^*$ (Complete)

$$\mathcal{A} = i \frac{\alpha_s}{\pi} \frac{G_F}{\sqrt{2}} \bar{s}(0) t^b t^a \sum_i \lambda_i T_{i\mu\nu} b(0) \epsilon_a^\mu(-p) \epsilon_b^\nu(p) + (\text{crossed}) ,$$

$$T_i^{\mu\nu} = T_{i\text{Box}}^{\mu\nu} + T_{i\text{Triangle}}^{\mu\nu} + T_{i\text{Self-energy}}^{\mu\nu} .$$

$$T_i^{\mu\nu} = (-i \epsilon^{\mu\nu\rho\sigma} p_\sigma \gamma_\rho L) A_i + (\mu-\nu \text{ symmetric part})$$

$$A_i = -\frac{8M_W^2}{m_i^2 - M_W^2} \left(1 + \frac{m_i^2}{2M_W^2} \right) \int_0^1 dx x(1-x) \ln \frac{D}{C}$$
$$+ \frac{2M_W^2}{m_i^2 - M_W^2} \left(1 - \frac{m_i^2}{2M_W^2} \right) \int_0^1 dx (1-x) \left\{ (3x-1) \mathbb{Y}_1 + [x^2(1-x)p^2 + (x+1)m_i^2] \mathbb{Y}_2 \right\}$$

$\eta' g^* g^*$ form-factor I

$\eta' g^* g^*$ form-factor I

- $g^* g^* \eta'$ form-factor $F_{\eta' g^* g^*}$ poorly known

$\eta' g^* g^*$ form-factor I

- $g^* g^* \eta'$ form-factor $F_{\eta' g^* g^*}$ poorly known
→ recent improvements via perturbative QCD:
 - [Muta and Yang (2000)]
 - [Ali and Parkhomenko (2002, 2003)]
 - [Kroll and Passek-Kumericki (2003)]

$\eta' g^* g^*$ form-factor I

- $g^* g^* \eta'$ form-factor $F_{\eta' g^* g^*}$ poorly known
→ recent improvements via perturbative QCD:
 - [Muta and Yang (2000)]
 - [Ali and Parkhomenko (2002, 2003)]
 - [Kroll and Passek-Kumericki (2003)]
- $F_{\eta' g^* g^*}$ defined via $\eta' \rightarrow g^*(k_1) g^*(k_2)$ amplitude:

$$N_{\mu\nu}^{ab}(\bar{Q}^2, \omega) = -i F_{\eta' g^* g^*}(\bar{Q}^2, \omega) \epsilon_{\mu\nu k_1 k_2} \delta^{ab},$$

$$\bar{Q}^2 = -\frac{k_1^2 + k_2^2}{2} \quad \omega = \frac{k_1^2 - k_2^2}{k_1^2 + k_2^2}$$

$\eta' g^* g^*$ form-factor II

- For $\bar{Q}^2 \gtrsim m_b^2$

$$F_{\eta' g^* g^*}(\bar{Q}^2, 0) = 4\pi\alpha_s(\bar{Q}^2) \frac{f_{\eta'}^1}{\sqrt{3}\bar{Q}^2} \left(1 - \underbrace{\frac{1}{12} B_2^g(\bar{Q}^2)}_{|\eta'\rangle = |gg\rangle} \right)$$

$$f_{\eta'}^1 \approx 1.15\sqrt{2}f_\pi$$

$\eta' g^* g^*$ form-factor II

- For $\bar{Q}^2 \gtrsim m_b^2$

$$F_{\eta' g^* g^*}(\bar{Q}^2, 0) = 4\pi\alpha_s(\bar{Q}^2) \frac{f_{\eta'}^1}{\sqrt{3}\bar{Q}^2} \left(1 - \underbrace{\frac{1}{12} B_2^g(\bar{Q}^2)}_{|\eta'\rangle = |gg\rangle} \right)$$

$$f_{\eta'}^1 \approx 1.15\sqrt{2}f_\pi$$

- Double suppression of $F_{\eta' g^* g^*}$:

$$\left. \begin{array}{l} 1/\bar{Q}^2 \\ \alpha_s(\bar{Q}^2) \text{ running} \end{array} \right\} \text{ for } \bar{Q}^2 \gg$$

Gluing two pieces together

- Combining amplitudes for $b \rightarrow sg^*g^*$ and $g^*g^* \rightarrow \eta'$

Gluing two pieces together

- Combining amplitudes for $b \rightarrow sg^*g^*$ and $g^*g^* \rightarrow \eta'$

$$\begin{aligned}
 \mathcal{A}(b \rightarrow s\eta') &= \frac{G_F}{8\sqrt{2}\pi^3} (\phi_{\eta'} \bar{s} \not{P}_{\eta'} L b) \sum_{i=u,c,t} \lambda_i \\
 &\times \int_{\mu^2 \sim m_b^2}^{M_W^2} dQ^2 \alpha_s(Q^2) F_{\eta'g^*g^*}(Q^2) A_i(-Q^2)
 \end{aligned}$$

Gluing two pieces together

- Combining amplitudes for $b \rightarrow sg^*g^*$ and $g^*g^* \rightarrow \eta'$

$$\mathcal{A}(b \rightarrow s\eta') = \frac{G_F}{8\sqrt{2}\pi^3} (\phi_{\eta'} \bar{s} \not{P}_{\eta'} L b) \sum_{i=u,c,t} \lambda_i$$

$$\times \int_{\mu^2 \sim m_b^2}^{M_W^2} dQ^2 \alpha_s(Q^2) F_{\eta' g^* g^*}(Q^2) A_i(-Q^2)$$

- $\mathcal{A}(b \rightarrow s\eta') \rightarrow \mathcal{A}(B \rightarrow K\eta')$ via factorization

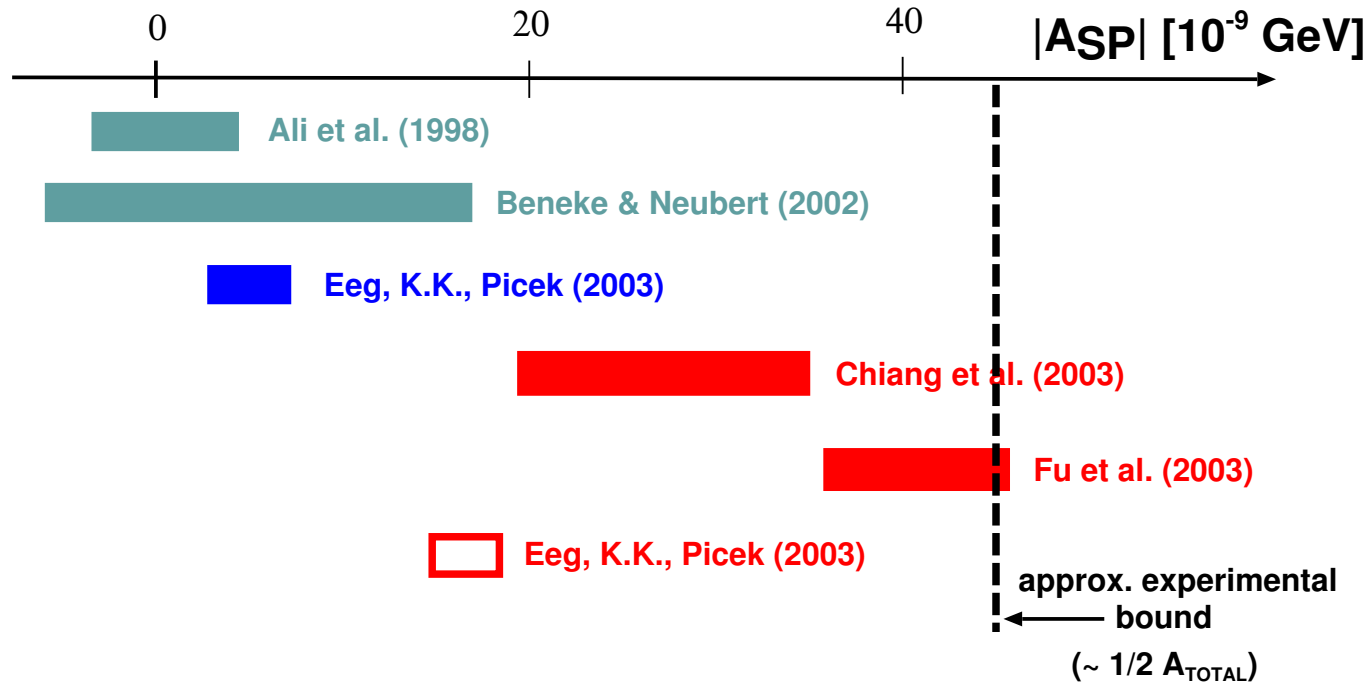

IR cut-off dependence

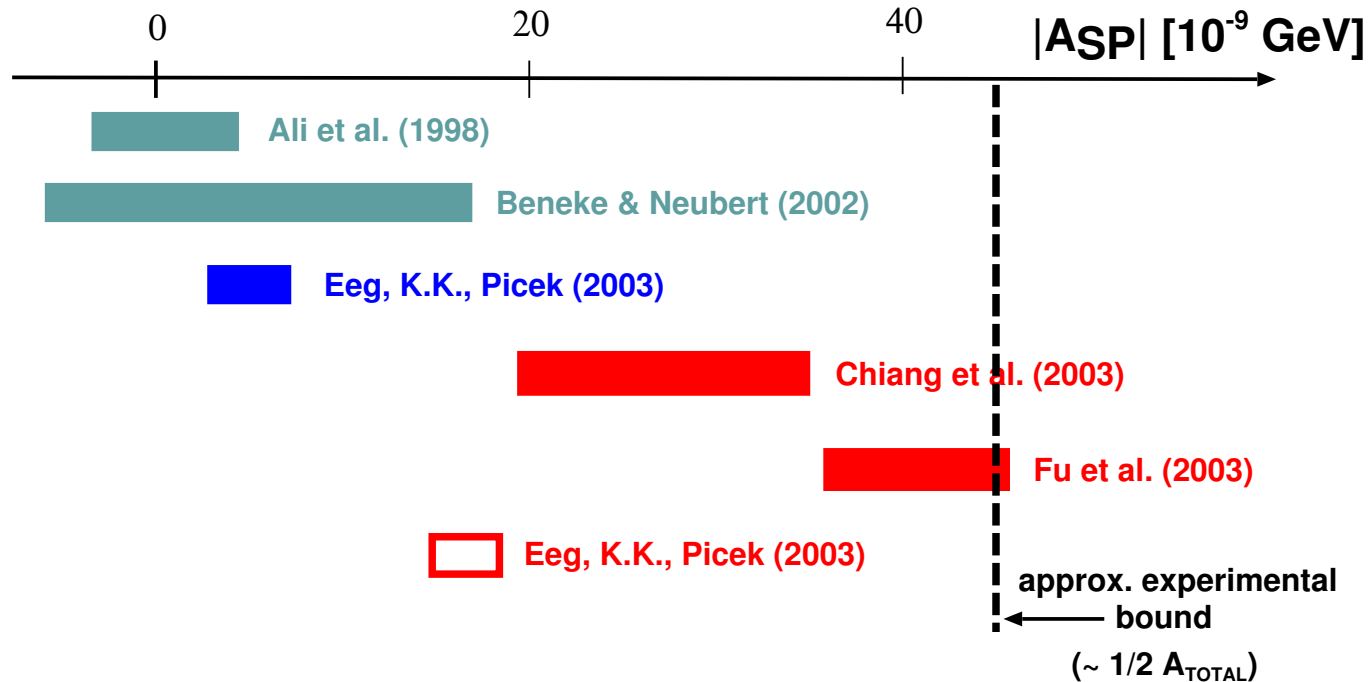

Comparison of two approaches II

Comparison of two approaches II

Comparison of two approaches II

- (One must add SD (blue) on top of LD (gray-blue) and then compare with SU(3) (red).)
- Discrepancy smaller but still exists!

Conclusions

- Singlet penguin gluonic mechanism has **significant** but **not dominant** role in $B \rightarrow K \eta'$ amplitude

Conclusions

- Singlet penguin gluonic mechanism has **significant** but **not dominant** role in $B \rightarrow K \eta'$ amplitude
- Maybe "significant" \rightarrow "detectable"

Conclusions

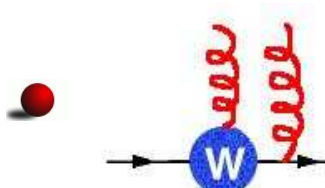

- Singlet penguin gluonic mechanism has **significant** but **not dominant** role in $B \rightarrow K \eta'$ amplitude
- Maybe "significant" \rightarrow "detectable"
- No new physics is needed, but better understanding of the discrepancy between two described approaches would be welcome

Conclusions

- Singlet penguin gluonic mechanism has **significant** but **not dominant** role in $B \rightarrow K \eta'$ amplitude
- Maybe "significant" \rightarrow "detectable"
- No new physics is needed, but better understanding of the discrepancy between two described approaches would be welcome

The End

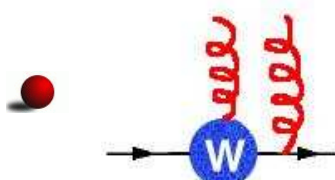

F1-F2 interplay

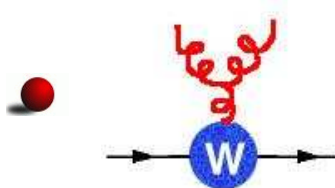

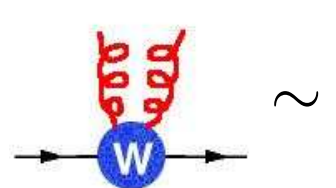

The diagram shows a red dot on the left, a blue circle with the letter 'W' in the middle, and two red wavy lines on the right. The 'W' circle is connected to the red dot by a horizontal line with an arrow pointing right. The two red wavy lines are connected to the 'W' circle by vertical lines.

$$\sim F_1(x)(p^2\gamma^\mu - \not{p}p^\mu)L - F_2(x)i\sigma_{\mu\nu}q^\nu m_b R$$

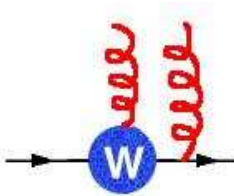

F1-F2 interplay

 $\sim F_1(x)(p^2\gamma^\mu - \not{p}p^\mu)L - F_2(x)i\sigma_{\mu\nu}q^\nu m_b R$

 $\sim \begin{matrix} (F_1\text{-terms}) \\ + \\ (F_2\text{-terms}) \end{matrix}$

 $\sim \begin{matrix} (F_1\text{-terms}) \\ + \\ (F_2\text{-terms}) \end{matrix}$

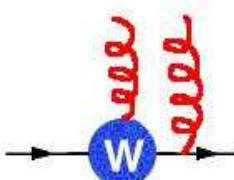

F1-F2 interplay

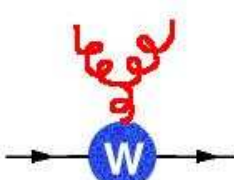

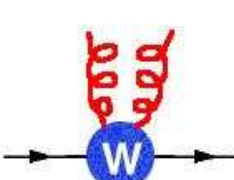

•  $\sim F_1(x)(p^2\gamma^\mu - \not{p}p^\mu)L - F_2(x)i\sigma_{\mu\nu}q^\nu m_b R$

•  $\sim \begin{matrix} (F_1\text{-terms}) \\ + \\ (F_2\text{-terms}) \end{matrix}$  $\sim \begin{matrix} (F_1\text{-terms}) \\ + \\ (F_2\text{-terms}) \end{matrix}$

• $x \ll 1 \Rightarrow (F_1 \sim \ln x) \gg (F_2 \sim x^2 \ln x)$

F1-F2 interplay

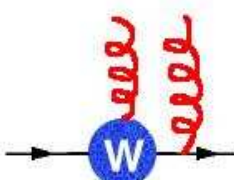

- 
 $\sim F_1(x)(p^2\gamma^\mu - \not{p}p^\mu)L - F_2(x)i\sigma_{\mu\nu}q^\nu m_b R$

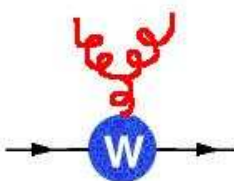

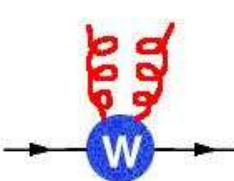

- 
 $\sim \begin{matrix} (F_1\text{-terms}) \\ + \\ (F_2\text{-terms}) \end{matrix}$

 $\sim \begin{matrix} (F_1\text{-terms}) \\ + \\ (F_2\text{-terms}) \end{matrix}$

- $x \ll 1 \Rightarrow (F_1 \sim \ln x) \gg (F_2 \sim x^2 \ln x)$

- F_1 terms cancel for **on-shell** or **soft** gluons (Ward identities, low-energy theorem [Low(1958)]) \Rightarrow suppression

F1-F2 interplay

- 
 $\sim F_1(x)(p^2\gamma^\mu - \not{p}p^\mu)L - F_2(x)i\sigma_{\mu\nu}q^\nu m_b R$

- 
 $\sim \begin{matrix} (F_1\text{-terms}) \\ + \\ (F_2\text{-terms}) \end{matrix}$
- 
 $\sim \begin{matrix} (F_1\text{-terms}) \\ + \\ (F_2\text{-terms}) \end{matrix}$

- $x \ll 1 \Rightarrow (F_1 \sim \ln x) \gg (F_2 \sim x^2 \ln x)$

- F_1 terms cancel for **on-shell** or **soft** gluons (Ward identities, low-energy theorem [Low(1958)]) \Rightarrow suppression

- but not for **hard off-shell** gluons ([Witten (1977)]!)
