Selma Supek obtained her diploma, M.Sc., and doctoral degrees in physics at the Department of Physics. Her thesis research on the retinotopic organization of the human visual cortex and spatio-temporal resolution of MEG was done at the Biophysics Group, *Los Alamos National Laboratory - LANL* (1988-1993, NIH/NEI EY08610, mentors Cheryl Aine and Leon Heller). After returning back to Zagreb she established collaborations with MEG laboratories at LANL; UNM (via bilateral University agreement) and the Mind Research Network; ITAB, Chieti; BioMag Laboratory, Helsinki; Department of Neurology, University of Heidelberg; TU Ilmenau (via bilateral University agreement); and University of Jena and introduced functional brain imaging methods, in particular MEG in Croatia both in research and education programs. Without any laboratory facility, and a rather low research funding, she started research projects covering topics of sensory and cognitive neurodynamics. She mentored 27 diploma and 2 doctoral physics students. So far 6 of her physics students obtained doctoral degrees with their thesis topics related to functional brain imaging (4 at international laboratories and 2 at the Department of Physics). Selma Supek introduced also the field of functional brain imaging to diploma and doctoral programs at the Department of Physics, Faculty of Science and the School of Medicine, both within University of Zagreb. She also founded a series of intensive graduate courses *MIND AND BRAIN* www.brain.com.hr within the academic program of the InterUniversity Centre Dubrovnik and co-founded the first university interdisciplinary international postgraduate program "*Language Communication and Cognitive Neuroscience*" at the University of Zagreb.

Research interests of Selma Supek include: cognitive neurodynamics, aging and neurodegeneration, educational neuroscience, neurodynamics of auditory cortex, functional and retinotopic organization of the visual cortex (doctoral and current research), spatio-temporal resolution of magnetoencephalography (doctoral and current research), semi-empirical methods for a quantum theory of small molecules (master program research). Future interests include multi-sensory integration, cross-sensory processing, time processing, perceptual integration, translational and clinical MEG research.
